508.1.6.2 Fire Department Communications System. Two way hard wired communication system is required in high rise buildings.

510.4.1.2 Minimum signal strength out of the building. The minimum outbound signal strength shall be sufficient to provide usable voice communications throughout the coverage area as specified by the fire code official. The outbound signal level shall be sufficient to provide not less than a DAQ of 3.0 or an equivalent SINR applicable to the technology for either analog or digital signals. A Bit Error Rate (BER) of 2.6% is equivalent to a DAQ 3.0 and is acceptable to meet this equivalency.

907.2.12.2 Fire department communication system. Two way hard wired fire department communication system is required in high-rise buildings. In other buildings where a wired communication system is approved in lieu of an emergency responder radio coverage system in accordance with Section 510, the wired fire department communication system shall be designed and installed in accordance with NFPA 72 and shall operate between a fire command center complying with Section 508, elevators, elevator lobbies, emergency and standby power rooms, fire pump rooms, areas of refuge and inside interior exit stairways. The fire department communication device shall be provided at each floor level within the interior exit stairway.

914.3.5 Emergency voice/alarm communication system. An emergency voice/alarm communication system shall be provided in accordance with Section 907.6.2.2. Two way hard wired fire department communication system is required in high-rise buildings.

2808.7.3 Conveyor Systems. Automatic sprinkler protection shall be provided in conveyor tunnels and combustible enclosures that pass under a pile. Combustible conveyor systems and enclosed conveyor systems shall be equipped with an approved automatic sprinkler system.

2808.7.4 Fire Hydrants. The fire code official may increase the distance required to a fire hydrant as set forth in Section 507 where the conditions of this section are complied with. The omitting of an on-site hydrant or increased overall distance to the nearest hydrants will be evaluated with the application for permit.

2808.9 Material-handling equipment. Approved material handling equipment shall be available for moving wood chips, hogged material, wood fines and raw product during fire-fighting operations. Equipment available shall include:
   1. Equipment to move stored material during a fire
   2. Water trucks
   3. Water pumps if using pond for any piece of water source

2808.6.1 Internal temperature. If any location in a pile is found to have an internal temperature of 160°F (71°C) immediate action must be taken to reduce the temperature. If any location in a pile is found to have an internal temperature of 180°F (82°C) or greater, the following procedures must immediately be taken:
   1. The area with the high temperature shall be dug out of the main pile. This overheated material shall be pushed out in the designated push out area. The material shall be no greater than 3ft. in depth in the push out area.
   2. Water shall be stationed closely to the affected area, prior to digging out the hotspot, to immediately douse any flare ups that may occur when air is added to overheated area.
   3. Continual temperature probing and removal of material greater than 180°F (82°C) shall be conducted until all overheated material is separated into the push out area.

2808.7.1 Delivery and tipping area. Not more than two designated tipping areas may be provided at a single facility and Delivery and tipping areas shall be shown on the approved facility site plan. Tipping areas shall comply with the following:
   1. Size. Tipping areas shall not exceed a maximum area of 50 feet by (15 240 mm) by 50 feet (15 240 mm).
   2. Height. Material within a tipping area shall not exceed 5 feet (1524 mm) in height at any time.
   3. Separation. Tipping areas shall be separated from all piles and other tipping areas by a fire access lane that is not less than 20 feet (6096 mm) wide.
   4. Water system. A water system shall be available to wet down/cool the raw product in case of fire within the tipping area.
   5. Duration. Raw product shall be kept in tipping area long enough to ensure no load was delivered that is already over heated. Raw product shall be less than 160°F before mixing with main pile.
TIPPING AREA. An area within a solid waste management facility or recycling facility for vehicles to unload new material, solid wastes or recyclables.

1204.2.1 Solar photovoltaic systems for Group R-3 buildings. Solar photovoltaic systems for Group R-3 buildings shall comply with Sections 1204.2.1.1 through 1204.2.1.3.

1204.2.1.1 Roof access points. Roof access points shall be located in areas that do not require the placement of ground ladders over openings such as windows or doors and located at strong points of building construction in locations where the access point does not conflict with overhead obstructions such as tree limbs, wires, or signs.

1204.2.1.1 Pathways to ridge. Not fewer than two 36 inch-wide (914 mm) pathways on separate roof planes, from lowest roof edge to ridge, shall be provided on all buildings. Not fewer than one pathway shall be provided on the street or driveway side of the roof. For each roof plane with a photovoltaic array, not fewer than one 36-inch-wide (914 mm) pathway from lowest roof edge to ridge shall be provided on the same roof plane as the photovoltaic array, on an adjacent roof plane or straddling the same and adjacent roof planes.

1204.2.1.2 Residential systems for one- and two-family dwellings. Access to residential systems for one- and two-family dwellings shall be provided in accordance with Sections 1204.2.1.3 through 1204.2.1.6.

1204.2.1.2 Setbacks at ridge. For photovoltaic arrays occupying 33 percent or less of the plan view total roof area, a setback of not less than 18 inches (457 mm) wide is required on both sides of a horizontal ridge. For photovoltaic arrays occupying more than 33 percent of the plan view total roof area, a setback of not less than 36 inches (457 mm) wide is required on both sides of a horizontal ridge.

1204.2.1.3 Residential buildings with hip roof layouts. Panels/modules installed on residential buildings with hip roof layouts shall be located in a manner that provides a 3-foot-wide (914 mm) clear access pathway from the eave to the ridge on each roof slope where panels/modules are located. The access pathway shall be located at a structurally strong location on the building capable of supporting the live load of firefighters accessing the roof.

1204.2.1.3 Alternative setbacks at ridge. Where an automatic sprinkler system is installed within the dwelling in accordance with Section 903.1.3, setbacks at the ridge shall conform to one of the following:
   1. For photovoltaic arrays occupying 66 percent or less of the plan view total roof area, a setback of not less than 18 inches (457 mm) wide is required on both sides of a horizontal ridge.
   2. For photovoltaic arrays occupying more than 66 percent of the plan view total roof area, a setback of not less than 36 inches (914 mm) wide is required on both sides of a horizontal ridge.

1204.2.1.4 Residential buildings with a single ridge. Panels/modules installed on residential buildings with a single ridge shall be located in a manner that provides two, 3-foot-wide (914 mm) access pathways from the eave to the ridge on each roof slope where panels/modules are located.

1204.2.1.5 Residential buildings with roof hips and valleys. Panels/modules installed on residential buildings with roof hips and valleys shall be located no closer than 18 inches (457 mm) to a hip or a valley where panels/modules are to be placed on both sides of a hip or valley. Where panels are to be located on only one side of a hip or valley that is of equal length, the panels shall be permitted to be placed directly adjacent to the hip or valley.

1204.2.1.6 Residential building smoke ventilation. Panels/modules installed on residential buildings shall be located no higher than 3 feet below the ridge in order to allow for fire department smoke ventilation operations.
